AB Tremor is a symptom of many disorders, including **Parkinson's** disease, essential **tremor**, orthostatic **tremor**, **cerebellar** disease, peripheral neuropathy and alcohol withdrawal. Tremors may be classified as postural, rest or action tremors. Symptomatic treatment is tailored to the tremor type. Combination therapy with carbidopa and levodopa remains the first-line approach for parkinsonian tremor. Essential tremor may be amenable to propranolol or primidone. Propranolol may be useful in treating alcohol withdrawal tremor, and isoniazid may control the cerebellar tremor associated with multiple sclerosis. Clonazepam may relieve orthostatic tremor. Other agents are also available for the treatment of tremor. When medical therapy fails to control the tremor, surgical options such as thalamotomy, pallidotomy and thalamic stimulation should be considered in severe cases. Thalamic stimulation, the most recent of these surgical approaches, offers the advantage over ablative procedures of alleviating tremor without the creation of a permanent lesion. -

AB Glutamatergic hyperactivity, secondary to dopaminergic denervation, is part of the pathophysiology of Parkinson's disease. Glutamatergic **antagonists**, especially **antagonists** of the **NMDA** type of glutamate receptor, have been proposed as potential anti-parkinson therapies. CI-1041, a **NMDA** receptor **antagonist** selective for the 1A/2B subtype of the NMDA receptor, was tested alone and in combination with L-DOPA in MPTP-treated monkeys. Unilateral infusion of MPTP into the carotid artery produces a hemi-parkinson monkey. Dopamine agonists such as L-DOPA, induce rotations contraversive to the side of the lesion. CI-1041, 3 mg/kg PO, potentiated L-DOPA - induced contraversive rotations in 2 of 3 hemi-parkinson monkeys tested. Subcutaneous administration of MPTP produces a full parkinson monkey characterized by akinesia, bradykinesia, and **tremor** with movement. Chronic daily administration of L-DOPA to full parkinson monkeys results in the development of dyskinesias similar to those observed in humans with idiopathic Parkinson's disease and chronically treated with L-DOPA. CI-1041 was tested from 0.3 to 30 mg/kg PO in combination with L-DOPA with mixed results. CI-1041 did not exhibit any anti-parkinson activity when administered alone and did not produce a consistent alteration in the anti-parkinson effects of L-DOPA. CI-1041, 3 mg/kg, produced a replicable reduction in L-DOPA-induced dyskinesias of 30 - 50% in 2 of 3 monkeys. Similar decreases in dyskinesias were observed with CI-1041 at 30 mg/kg, but not 10 mg/kg PO. These data suggest that CI-1041 may have potential as an adjunct to L-DOPA treatment of Parkinson's disease.

AB Glutamate receptors are implicated in the development and expression of
drug dependence. Substantial experimental evidence suggests that
antagonists acting at the **N-methyl-D**
-aspartate (NMDA) subtype of glutamate receptors attenuate the
severity of opioid withdrawal. However, it is less clear whether opioid
withdrawal can be potentiated by agonists of glutamate receptors. The
present study evaluated the behavioural effects of various agonists of
glutamate receptors, as well as a nitric oxide (NO) donor, in
morphine-dependent rats trained to discriminate 0.1 mg/kg of naloxone from
saline. None of the following drugs produced appreciable levels of
naloxone-like responding (substitution tests) or potentiated the
discriminative stimulus effects of naloxone: NMDA (3-56 mg/kg), glycine
(100-1000 mg/kg), glutamate (1000-3000 mg/kg), kainate (0.3-3 mg/kg),
isosorbide dinitrate (30-300 mg/kg). Nevertheless, expression of some
morphine withdrawal-like somatic and behavioural signs ('wet-dog'-like
shaking, scream on touch, ptosis, **tremor**, chewing, weight loss)
was facilitated by NMDA, glycine, and isosorbide dinitrate. These results
suggest that, compared to somatic symptoms, subjective effects of opioid
withdrawal (as reflected by discriminative stimulus effects) are not
mimicked by direct activation of glutamate receptors.
